

# Global Attitudes on Abortion Collected for BuzzFeed

### **Research Methodology & Internet Penetration**

66.4%

**Argentina** 

- Interviews were conducted via Ipsos' Global Advisor online Omnibus from April 24<sup>th</sup> – May 8<sup>th</sup> 2015.
- The study is based on interviews with 17,030 adults across 23 countries, with sample sizes as below:
  - Approximately 500 interviews conducted in each of Argentina, Belgium, Mexico, Poland, Russia, South Africa, South Korea, Sweden, Turkey, Hungary, India, and Ireland)
  - Approximately 1,000 interviews conducted in each of Australia, Brazil, Canada, China, France, Germany, Great Britain, Italy, Japan, Spain, and the United States).
- Data are weighted to age, gender, region and household income based on recent Census and/or population figures for each country. The global numbers were calculated such that each market was given equal weight when aggregated (unweighted base size = 500 for all)
- Where internet penetration is more than approx. 60%, the data output is comparable to the general population.
- Of the those surveyed, 15 countries yield results that are balanced to reflect the general population: Argentina, Australia, Belgium, Canada, France, Germany, Hungary, Italy, Japan, Poland, South Korea, Spain, Sweden, United Kingdom and United States
- The nine remaining countries surveyed —Brazil, China, India, Indonesia, Mexico, Russia, Saudi Arabia, South Africa and Turkey reflect online populations that tend to be more urban and have higher education/income than the general population.

**Australia** 88.8% **Belgium** 81.4% **Brazil** 45.6% Canada 83.0% China 40.1% France 79.6% Germany 83.0% **Great Britain** 83.6% 65.4% Hungary India 11.4% Indonesia 22.1% Italy 58.4% 79.5% Japan Mexico 36.5% **Poland** 64.9% Russia 47.7% Saudi Arabia 49.0% **South Africa 17.4% South Korea** 82.5% Spain 67.2%

**United States** 

Sweden

**Turkey** 

92.7%

45.7%

78.1%

#### 23 Country Views on Abortion

- Abortion SHOULD be permitted whenever a woman decides she wants one
- Abortion SHOULD be permitted in certain circumstances, such as if a woman has been raped
- Abortion should NOT be permitted under any circumstances, except when the life of the mother is in danger
- Abortion should NEVER be permitted, no matter what circumstance exists

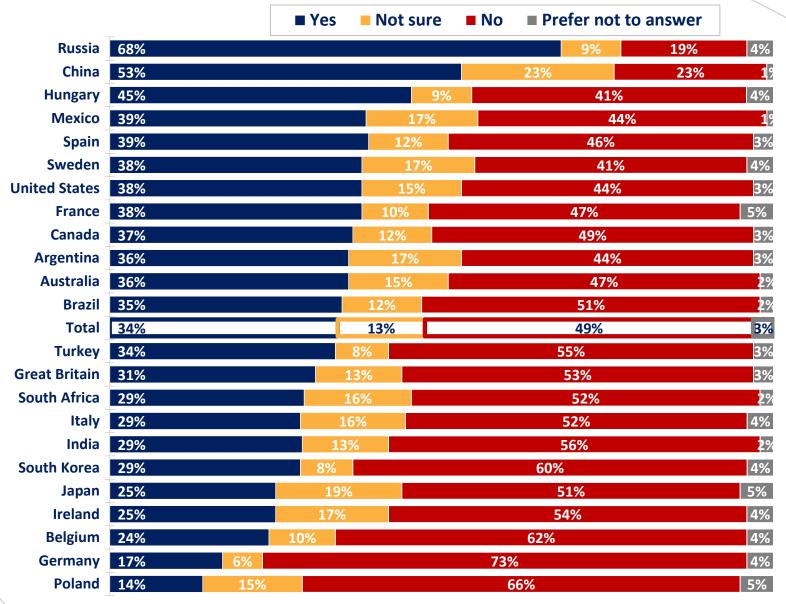

Abortion should Nevek be permitted, no matter what circumstance exists

%Abortion should

## One Third (39%) of Women Have Had or Know of Someone Close to Them Ever Had an Abortion

#### **Technical Notes and Methodology**

The calculation of credibility intervals assumes that Y has a binomial distribution conditioned on the parameter  $\theta \setminus$ , i.e.,  $Y \mid \theta^{\sim} Bin(n, \theta)$ , where n is the size of our sample. In this setting, Y counts the number of "yes", or "1", observed in the sample, so that the sample mean  $(\overline{y})$  is a natural estimate of the true population proportion θ. This model is often called the likelihood function, and it is a standard concept in both the Bayesian and the Classical framework. The Bayesian <sup>1</sup> statistics combines both the prior distribution and the likelihood function to create a posterior distribution. The posterior distribution represents our opinion about which are the plausible values for  $\theta$  adjusted after observing the sample data. In reality, the posterior distribution is one's knowledge base updated using the latest survey information. For the prior and likelihood functions specified here, the posterior distribution is also a beta distribution  $(\pi(\theta/y)^{\sim}\beta(y+a,n-y+b))$ , but with updated hyper-parameters.

Our credibility interval for  $\vartheta$  is based on this posterior distribution. As mentioned above, these intervals represent our belief about which are the most plausible values for  $\vartheta$  given our updated knowledge base. There are different ways to calculate these intervals based on  $\pi(\theta/y)$ . Since we want only one measure of precision for all variables in the survey, analogous to what is done within the Classical framework, we will compute the largest possible credibility interval for any observed sample. The worst case occurs when we assume that a=1 and b=1 and y=n/2. Using a simple approximation of the posterior by the normal distribution, the 95% credibility interval is given by, approximately:  $\bar{v} \mp \frac{1}{2}$ 

For this poll, the Bayesian Credibility Interval was adjusted using standard weighting design effect 1+L=1.3 to account for complex weighting<sup>2</sup>. Examples of credibility intervals for different base sizes are below. Ipsos does not publish data for base sizes (sample sizes) below 100.

These are findings from an Ipsos poll conducted for BuzzFeed from April 24-May 8, 2015. Data was collected in: Argentina, Australia, Belgium, Canada, France, Germany, Hungary, Italy, Japan, Poland, South Korea, Spain, Sweden, United Kingdom, Brazil, China, India, Mexico, Russia, South Africa and Turkey and the United States of America. An international sample of 17,030 adults aged 18-64 in the US and Canada, and age 16-64 in all other countries, were interviewed. Approximately 1000+ individuals participated on a country by country basis except in Argentina, Belgium, Mexico, Poland, Russia, South Africa, South Korea, Sweden, Turkey, Hungary, India, and Ireland, where each have a sample 500+. Weighting was then employed to balance demographics and ensure that the sample's composition reflects that of the adult population according to the most recent country Census data and to provide results intended to approximate the sample universe.

The precision of Ipsos online polls are calculated using a credibility interval. In this case, a poll of 1,000 is accurate to +/- 3.5 percentage points and one of 500 is accurate to +/- 5.0 percentage points in their respective general populations. All sample surveys and polls may be subject to other sources of error, including, but not limited to coverage error, and measurement error. For more information on credibility intervals, please visit the Ipsos website at http://ipsos-na.com/dl/pdf/research/publicaffairs/IpsosPA CredibilityIntervals.pdf

Sample size	Credibility intervals
2,000	2.5
1,500	2.9
1,000	3.5
750	4.1
500	5.0
350	6.0
200	7.9
100	11.2
