PUBLIC POLL FINDINGS AND METHODOLOGY

About the Study

These are some of the findings of the sixth wave of an Ipsos poll conducted between May 28-29, 2020. For this survey, a sample of roughly 1,113 adults age 18+ from the continental U.S., Alaska, and Hawaii was interviewed online in English. The first wave was conducted between April 10-13, the second was conducted April 17-20, 2020, the third was conducted April 27-28, 2020, the fourth was conducted May 4-5, 2020, and the fifth wave was conducted May 14-15, 2020, all among a sample of more than 1,110 adults.

The sample for this study was randomly drawn from Ipsos' online panel (see link below for more info on "Access Panels and Recruitment"), partner online panel sources, and "river" sampling (see link below for more info on the Ipsos "Ampario Overview" sample method) and does not rely on a population frame in the traditional sense. Ipsos uses fixed sample targets, unique to each study, in drawing a sample. After a sample has been obtained from the Ipsos panel, Ipsos calibrates respondent characteristics to be representative of the U.S. Population using standard procedures such as raking-ratio adjustments. The source of these population targets is U.S. Census 2016 American Community Survey data. The sample drawn for this study reflects fixed sample targets on demographics. Post-hoc weights were made to the population characteristics on gender, age, race/ethnicity, region, and education.

Statistical margins of error are not applicable to online non-probability polls. All sample surveys and polls may be subject to other sources of error, including, but not limited to coverage error and measurement error. Where figures do not sum to 100, this is due to the effects of rounding. The precision of Ipsos online polls is measured using a credibility interval. In this case, the poll has a credibility interval of plus or minus 3.3 percentage points for all respondents. Ipsos calculates a design effect (DEFF) for each study based on the variation of the weights, following the formula of Kish (1965). This study had a credibility interval adjusted for design effect of the following (n=1,113, DEFF=1.5, adjusted Confidence Interval=+/-4.8 percentage points).

The first, fourth, and fifth waves of this study have a credibility interval of plus or minus 3.3 percentage points for all respondents, while the second and third waves of this study have a credibility interval of plus or minus 3.4 percentage points for all respondents.
