PUBLIC POLL FINDINGS AND METHODOLOGY

About the Study

These are the findings of an Ipsos poll conducted October 27 – November 1, 2020, on behalf of Thomson Reuters. For this study, a total of 1,007 adults age 18+ from Michigan were interviewed online in English, including 654 likely voters. The first wave of this poll was conducted September 11-16, 2020, among 1,005 adults age 18+ from Michigan, including 637 likely voters. The second wave of this poll was conducted September 29 – October 6, 2020, among 1,098 adults age 18+ from Michigan, including 709 likely voters. The third wave of this poll was conducted from October 7-13, 2020 among 985 adults age 18+ from Michigan, including 620 likely voters. The fourth wave of this poll was conducted from October 14-20, 2020 among 1,001 adults age 18+ from Michigan, including 686 likely voters. The fifth wave of this poll was conducted from October 20-26, 2020 among 1,005 adults age 18+ from Michigan, including 652 likely voters.

The sample for this study was randomly drawn from Ipsos' online panel (see link below for more info on "Access Panels and Recruitment"), partner online panel sources, and "river" sampling (see link below for more info on the Ipsos "Ampario Overview" sample method) and does not rely on a population frame in the traditional sense. Ipsos uses fixed sample targets, unique to each study, in drawing a sample. After a sample has been obtained from the Ipsos panel, Ipsos calibrates respondent characteristics to be representative of the U.S. Population using standard procedures such as raking-ratio adjustments. The source of these population targets is U.S. Census 2018 American Community Survey data. The sample drawn for this study reflects fixed sample targets on demographics. Posthoc weights were made to the population characteristics on gender, age, race/ethnicity, region, and education.

Statistical margins of error are not applicable to online non-probability polls. All sample surveys and polls may be subject to other sources of error, including, but not limited to coverage error and measurement error. Where figures do not sum to 100, this is due to the effects of rounding. The precision of Ipsos online polls is measured using a credibility interval. In this case, the online sample for this poll has a credibility interval of plus or minus 3.5 percentage points for all online respondents. Ipsos calculates a design effect (DEFF) for each study based on the variation of the weights, following the formula of Kish (1965). This study had a credibility interval adjusted for design effect of the following ($n=1,007$, $DEFF=1.5$, adjusted Confidence Interval= ± 5.0 percentage points). The online poll also has a credibility interval of plus or minus 4.4 percentage points for likely voters.

The first wave has a credibility interval of plus or minus 3.5 percentage points for all online respondents and plus or minus 4.4 percentage points for likely voters. The second wave has a credibility interval of plus or minus 3.4 percentage points for all online respondents and plus or minus 4.2 percentage points for likely voters. The third wave has a credibility interval of plus or minus 3.6 percentage points for all online respondents and plus or minus 4.5 points for likely voters. The fourth wave has a credibility interval of plus or minus 3.5 percentage points for all online respondents and plus or minus 4.3 points for likely voters. The fifth wave has a credibility interval of plus or minus 3.5 percentage points for all online respondents and plus or minus 4.4 points for likely voters.
