The margin of sampling error is plus or minus 1.8 percentage points at the 95% confidence level, for results based on the entire sample of adult. The margin of error takes into account the design effect, which was 1.4 for all adults. Our reporting of the findings, percentage points are rounded off to the nearest whole number. As a result, percentages in a given table column may total slightly higher or lower than 100%. In questions that permit multiple responses, columns may total substantially more than 100%, depending on the number of different responses offered by each respondent.
