

This ABC News/Washington Post/Ipsos poll was conducted among 2,560 U.S. adults, Apr. 24-28, 2026, via the probability-based Ipsos KnowledgePanel®. Results have a margin of sampling error of plus or minus 2 percentage points for the full sample, including design effects due to weighting. The error margin is plus or minus 2.2 points for the sample of 2,059 registered voters the error margin is plus or minus 2.8 points for the half-sample questions asked of 1,268-1,292 U.S. adults. Sampling error is not the only cause of differences in polls. Sampling, fieldwork and data processing were provided by Ipsos Public Affairs.

Where noted, trend comparisons are to random-digit-dialed telephone surveys ("CATI mode") by The Washington Post and ABC News or others. Questions were reformatted as of January 2024 given the change to a self-administered online questionnaire. Differences from previous results may reflect mode effects.

See full methodological details at the end of this document.

In the tables below, asterisks in data columns indicate <0.5 percent. "Skipped" shows the share of respondents who skipped the question in online administration. "Skipped/No opinion" shows the share of respondents who skipped the question or who selected an explicit "no opinion" option in online administration. Respondents interviewed via telephone were able to volunteer a "no opinion" response. Phrases surrounded by parentheses within questions indicate clauses that were randomly rotated for respondents.

Questions 1-32 held for release.

33. The Trump administration has torn down the East Wing of the White House to make way for a 90,000 square-foot ballroom, paid for by \$400 million in private donations from U.S. businesses and individuals. Do you support or oppose this project? (Half sample)

METHODOLOGICAL DETAILS

This poll was jointly sponsored and funded by The Washington Post, ABC News and Ipsos. The poll includes a random sample of 2,560 U.S. adults. Interviews were conducted in English and Spanish.

The questionnaire was administered with the exact questions in the exact order as they appear in this document. Demographic questions are not shown. If a question was asked of a reduced base of the sample, a parenthetical preceding the question identifies the group asked. Phrases surrounded by parentheticals within questions indicate clauses that were randomly rotated for respondents.

Ipsos conducted sampling, interviewing and tabulation for the survey using the KnowledgePanel, a nationwide survey panel designed to be representative of the U.S. adult population. KnowledgePanel members are recruited through probability sampling methods using address-based sampling. Panel members who do not have internet access are provided with a tablet and internet service. KnowledgePanel members receive a per survey incentive, usually the equivalent of \$1 (though for some it is \$2) in points that can be redeemed for cash or prizes.

In this poll, invitations were sent to 3,860 panelists, resulting in 2,560 completed interviews. In quality control, 75 respondents were removed for skipping half or more of the questions for which they were eligible or for completing the survey among the fastest 1 percent of interviews.

Ipsos used probability-proportional-to-size sampling to draw a national sample of adults using the KnowledgePanel matching U.S. population benchmarks. This survey uses statistical weighting procedures to account for deviations in the survey sample from known population characteristics, which helps correct for differential survey participation and random variation in samples.

The following table shows unweighted, weighted and benchmark values for weighting variables:

	Unweighted	Weighted	Benchmark

Political party identification benchmarks are from the 2025 NPORS annual survey, with a midyear adjustment estimated across aggregated KnowledgePanel surveys accounting for changes in panelists' party identification over time.

All error margins have been adjusted to account for the survey's design effect, which is 1.07 for this survey. The design effect is a factor representing the survey's deviation from a simple random sample and takes into account decreases in precision due to sample design and weighting procedures.
