

These are findings from an Ipsos poll conducted for Thomson Reuters April 6-8, 2015. For the survey, a sample of 892 ages 18+ were interviewed online. The precision of the Reuters/Ipsos online polls is measured using a [credibility interval](#). In this case, the poll has a credibility interval of plus or minus 3.7 percentage points. For more information about credibility intervals, please see the appendix.

The data were weighted to the U.S. current population data by gender, age, education, and ethnicity. Statistical margins of error are not applicable to online polls. All sample surveys and polls may be subject to other sources of error, including, but not limited to coverage error and measurement error. Figures marked by an asterisk (*) indicate a percentage value of greater than zero but less than one half of one per cent. Where figures do not sum to 100, this is due to the effects of rounding. To see more information on this and other Reuters/Ipsos polls, please visit <http://polling.reuters.com/>.

SAME SEX MARRAIGE

Q1. A recent state law allows businesses to make decisions based on religious beliefs. Do you agree or disagree with the following statements? (Added on 4/01/2015, n=3,220)

| | Agree | Disagree | Not sure |
|---|-------|----------|----------|
| Businesses should have the right to refuse services to certain people or groups based on the business's religious beliefs | 28% | 54% | 18% |
| Businesses should have the right not to hire certain people or groups based on the employer's religious beliefs | 27% | 55% | 18% |
| Businesses should not be allowed to discriminate (by refusing services or refusing to hire) on the basis of their religious beliefs | 60% | 24% | 16% |

Q2. Do you support or oppose allowing same-sex couples to legally marry?

| | |
|----------|-----|
| Support | 52% |
| Oppose | 32% |
| Not sure | 15% |

Q3. And which of the below is closest to your view about where same-sex marriage laws should be made in this country?

| | |
|---|-----|
| Same-sex marriage laws should be made at the state level by state legislators | 11% |
| Same-sex marriage laws should be made at the state level by voter referendum | 22% |
| Same-sex marriage laws should be made at the national level by Congress | 8% |
| Same-sex marriage laws should be made by the U.S. Supreme Court declaring a nationwide constitutional right | 34% |
| Don't know | 24% |

Q4. As you may know, there are some federal benefits associated with marriage, which include things like health insurance for a spouse and Social Security payments from a deceased working spouse. In your view, should same-sex married couples receive the federal benefits that heterosexual married couples receive, or not?

| | |
|--|-----|
| Same-sex married couples should receive these federal benefits | 61% |
| Same-sex married couples should not receive these federal benefits | 23% |
| Don't know | 16% |

Ipsos Poll Conducted for Reuters

Same-Sex Marriage 04.08.2015

Q5. Please indicate whether you agree or disagree with the following statements:

| | <u>Agree</u> | <u>Disagree</u> | <u>Not sure</u> |
|--|--------------|-----------------|-----------------|
| Same sex marriages from states where same-sex marriage is legal should be recognized in all states, including those that do not permit same-sex marriage. | 55% | 29% | 17% |
| Government officials in all states where same-sex marriage is legal should be required to issue marriage licenses to same-sex couples, even if it goes against their personal religious beliefs. | 61% | 22% | 17% |

How to Calculate Bayesian Credibility Intervals

The calculation of credibility intervals assumes that Y has a binomial distribution conditioned on the parameter θ , i.e., $Y|\theta \sim \text{Bin}(n, \theta)$, where n is the size of our sample. In this setting, Y counts the number of “yes”, or “1”, observed in the sample, so that the sample mean (\bar{y}) is a natural estimate of the true population proportion θ . This model is often called the likelihood function, and it is a standard concept in both the Bayesian and the Classical framework. The Bayesian ¹ statistics combines both the prior distribution and the likelihood function to create a posterior distribution. The posterior distribution represents our opinion about which are the plausible values for θ adjusted after observing the sample data. In reality, the posterior distribution is one’s knowledge base updated using the latest survey information. For the prior and likelihood functions specified here, the posterior distribution is also a beta distribution ($\pi(\theta/y) \sim \beta(y+a, n-y+b)$), but with updated hyper-parameters.

Our credibility interval for ϑ is based on this posterior distribution. As mentioned above, these intervals represent our belief about which are the most plausible values for ϑ given our updated knowledge base. There are different ways to calculate these intervals based on $\pi(\theta/y)$. Since we want only one measure of precision for all variables in the survey, analogous to what is done within the Classical framework, we will compute the largest possible credibility interval for any observed sample. The worst case occurs when we assume that $a=1$ and $b=1$ and $y=n/2$. Using a simple approximation of the posterior by the normal distribution, the 95% credibility interval is given by, approximately:

$$\bar{y} \pm \frac{1}{\sqrt{n}}$$

For this poll, the Bayesian Credibility Interval was adjusted using standard weighting design effect $1+L=1.3$ to account for complex weighting²

Examples of credibility intervals for different base sizes are below. Ipsos does not publish data for base sizes (sample sizes) below 100.

| Sample size | Credibility intervals |
|-------------|-----------------------|
| 2,000 | 2.5 |
| 1,500 | 2.9 |
| 1,000 | 3.5 |
| 750 | 4.1 |
| 500 | 5.0 |
| 350 | 6.0 |
| 200 | 7.9 |
| 100 | 11.2 |
